

Steps to Install:

- Clone/download project from the below repository
<https://github.com/harsh177/spring-boot-project>
- Install gradle latest version (as we have user 4.8.1)
- Import that project into your any favorite IDE (as we are using Eclipse – Oxygen)
- Do changes whatever you want to do (e.g. configure database details like mysql in application.properties and there respective profiles (application-dev.properties)).

Steps to build project:

- Now open command prompt and go to Messenger (i.e. project root) location and type below command
gradle clean build -x test
- now you will see generated jar inside build/libs/Messenger.jar

Steps to run project:

- Copy the above jar and place anywhere you want.
- Open command prompt and go to that jar location and type below command:
java -jar -Dspring.profiles.active=prod Messenger.jar
